## INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY

		_
International	application	No.

PCT/SE 2003/001574

Box No. V		Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement				
1.	Statement					
	Novel	ty (N)	Claims Claims	1-7	YES NO	
	Invent	ive step (IS)	Claims Claims	1-7	YES NO	
	Indust	rial applicability (IA)	Claims Claims	1-7	YES NO	

2. Citations and explanations (Rule 70.7)

This report is based on new claims filed after the Written Opinion.

## The claimed invention

The claimed invention relates to the problem concerning preventing that an improper sterile product is connected to medical technical equipment.

The problem is solved by arranging a fixed identification tag on the sterile product. The tag is read by a sensor on the equipment without touching the sterile product and a decision is made whether the sterile product is suitable to use or not.

### Prior art

In the International Search Report the following documents were cited:

D1: DE19822751

D2: US5591344

D3: WO0174421

D4: WO9305829

D5: US5131823

D6: EP1101506

D7: US5078683

D3 describes an angiographic injector subassembly. In D3 a bar code is placed on a sterile syringe and is read by a reader on the syringe holder. The bar code information is processed and the system is blocked and information is presented to the user if not an appropriate bar code was read. This system prevents the use of incompatible syringes. (See page 14, line 20-28.)

D5 describes a device for joining a connection piece to a peristaltic pump. (See figure 1-3 and abstract.)

#### Supplemental Box

In case the space in any of the preceding boxes is not sufficient. Continuation of: Box V.

D6 describes a medical gas delivering system. In D6 a sterile filter is attached to the gas delivering equipment. The sterile filter comprises a machine readable identification element, for example a bar code. When the filter is connected to the equipment the bar code is placed in front of reading unit that identifies the filter. Based in this identification an evaluation process starts. An evaluation unit comprises a memory, in which information on filters is stored. If a filter has been used before the memory contains information about this and the system then blocks the gas supply and alerts the user. If the filter has not been used before the system will start delivering gas. (See paragraphs 0008-0009 and 0016.)

Documents D1, D2, D4 and D7 represent the prior art. The claimed invention is not considered to be anticipated by these documents.

#### Statement of reason

The cited documents represent the general state of the art.

The invention defined in claims 1-7 is not disclosed by any of these documents.

The cited prior art does not give any indication that would lead a person skilled in the art to the claimed identification device. Therefore, the claimed invention is not obvious to a person skilled in the art.

Accordingly, the invention defined in claims 1-7 is novel and is considered to involve an inventive step. The invention is industrially applicable.

9

# PCT/SE03/01574 - AMENDED CLAIMS FILED 1 Nov. 2004

- 1. A medical-technical identification device for identifying a sterile product (4, 62, 72, 82), for example a product intended for one-time-use only, when connected to a piece of medical equipment (1, 60, 70, 80), and in that the sterile product (4, 62, 72, 82) includes a fixedly mounted information carrier (9, 63, 73, 83) which is adapted to deliver or to offer specific product information in a contactless fashion to a reading element (12, 64, 74, 84) connected to the equipment (1, 60, 70, 80), and that the reading element (12) is connected to a registering unit (13) which, in turn, is connected to both a storage unit (14) and an analysing unit (15), **characterised** in that the product is a sterile elastic hose part (4) or a sterile saw blade (62) or a sterile drill bit (72) or a sterile shaver blade (82) and that the analysing unit (15) functions to deliver signals to an equipment-actuating control unit and in that the device includes a presentation unit (16) which functions to present information from both the analysing unit (15) and the storage unit (14) and in that a programming unit is connected to one of said units.
- 2. An identification device according to claim 1, **characterised** in that the information carrier (9) is mounted in or on one side of a holder (8) and in that the reading element (12) is mounted in or on one side of a fixation seat (7), wherein the exchange of information between the information carrier (9) and the reading element (12) does not take place until the holder is in place in the seat (7), i.e. until connection of the hose part (4) to the equipment has been completed.

20

- 3. An identification device according to claim 2, **characterised** in that the information carrier (9) and the reading element (12) are adapted to take fixed positions relative to one another when the hose part (4) is connected actively to said equipment.
- 4. An identification device according to claim 3, **characterised** in that the holder (8) of the information carrier (9) includes a planar slide surface (10) which is angled such that the normal to said surface will not extend parallel with the symmetry axis of said hose part (4) and in that said slide surface conforms to or fits with a correspondingly directed slide surface (11) in the seat (7).

10

5. An identification device according to claim 4, **characterised** in that both slide surfaces (10, 11) are directed so that an applied force intended to press the surfaces (10, 11) together will cause the information carrier (9) and the reading element (12) to be aligned mutually in the direction of an X-axis and Y-axis.

6. An identification device according to claim 5, **characterised** in that both slide surfaces (10, 11) are directed so that the information carrier (9) and the reading element (12) will also be mutually aligned in the direction of an Z-axis.

7. An identification device according to any one of claims 1 - 6, characterised in that the transmission of information between the information carrier (9) and the reading element (12) is caused to take place with the aid of one or more of the following devices: bar codes, Blue Tooth, radio waves, light waves, e.g. infrared light, electromagnetism, radioactivity or chemical transmission.
